

TO: Governor Jay Inslee & State Senators and Representatives

We are among the hundreds of emergency service providers who responded to the 2014 Oso landslide disaster. We are not members of just one service organization or local community - but many. We are all citizens of the State of Washington concerned about what will happen when the next major disaster hits our state. Recovery efforts following the first few days after the Oso slide were made more difficult when state fire mobilization of additional resources was denied due to a defective state law. A state legal interpretation rendered the current state fire mobilization law (RCW 43.43.960) inoperable. No longer could state resources be mobilized to meet non-fire emergencies when local and regional resources were exhausted or are inadequate. The wording of the existing statute too narrowly defines criteria for activating state fire mobilization following major non-fire disasters. The law as now written and interpreted in Olympia does not apply to all risk disasters such as: earthquakes, landslides, floods, disease outbreak or epidemic, structural building collapses and technical rescues.

The statutory definition for "mobilization" must be corrected to enable activation for certain non-fire as well as fire incidents involving "all risk resources" encountered when responding to many types of major disasters. This seriously flawed Washington law can be easily be returned to its original intent to include state mobilization qualifying criteria to include "all risk resources." Fire protection and other emergency response agencies would once again have sufficient tools and capability to meet requirements they face at various types of emergency disasters where life or property is at risk. Multiple types of risk do require a wide variety of additional tools and resources. They are needed when what is available locally or regionally has been exhausted - particularly when those resources have been expended during the first days after disaster recovery and rescue efforts began.

This needed correction in state law can be easily accomplished without resulting in additional cost to the state treasury as most major disasters receive federal financial assistance once requisite official declarations are made. Legislation should be enacted in 2015 similar to a bill (HB 1126) considered during the previous session. Remedying this defect in state law is essential to correcting language that inadvertently prevents (as it did at the Oso slide) additional and sufficient state resources from reaching the scene of non-fire major disasters in a timely manner. It is vital to public safety that when circumstances and incident scale warrants, expedited activation of state fire mobilization be accomplished as soon as feasible. Providing vitally needed additional resources getting to local communities recovering from a major disaster of all risk types is an essential role of our state government.

Delay in state mobilization beyond the first couple of days following a major event is unacceptable. That is when state-authorized additional relief personnel or more resources are vitally needed to aid in recovery efforts. Delay can result in loss of additional lives and property putting first and secondary responders (including volunteers) at added risk.

We greatly appreciate all the resources that assisted with recovery from the Oso disaster that were provided by local, state, and federal governments, as well as private individuals, groups and organizations. When inevitably there is a future major disaster in Washington (that may not be a wildfire), emergency responders need expedited, formal activation of state fire mobilization to save the maximum number of lives and prevent further injuries. Therefore, we respectfully urge that the state fire mobilization law be updated in 2015. Future official declarations necessary to activate state mobilization should be made based on an updated law when emergency conditions on the ground visibly meet state regulatory requirements - regardless of whether or not fire is involved in the disaster.
